IIR CONFERENCES: GUIDELINES FOR USING ARTIFICIAL INTELLIGENCE

Ethics of Scientific writing and use of AI-Generated Content

In line with the IIR's commitment to scientific integrity, all contributors to IIR Conferences are expected to uphold high ethical standards in the preparation of content. This includes ensuring originality, proper attribution of sources, and transparency in the development process. The use of AI tools – such as those for drafting, editing, or translating – must be explicitly disclosed. While AI can support clarity and consistency, it must not replace expert judgment or introduce unverified information. Authors remain fully responsible for the accuracy, validity, and originality of all submitted content. AI-generated material should be carefully reviewed and edited to ensure it meets the scientific rigour and practical relevance expected in IIR conference proceedings. Practices such as plagiarism, data fabrication, and misrepresentation of sources are strictly prohibited. All contributors must ensure that their work reflects a genuine intellectual contribution and adheres to international standards for ethical scientific communication.
